Common Issues and Their Solutions

Even with diligent care, some problems can arise. Below are a few frequent issues along with concise solutions based on the manual's guidance.

Engine Stalling After a Long Ride

Stalling often results from a dirty air filter or a clogged fuel filter. According to the manual, you should:

- Replace the air filter if it’s visibly dirty
- Check the fuel filter and replace if clogged
- Inspect the throttle cable for proper adjustment

After addressing these points, test the bike to ensure smooth idling.

Brake Pedal Feeling Soft

A soft brake pedal can indicate low brake fluid or air in the brake lines. The manual recommends:

- Checking the brake fluid level and topping it up to the “Max” mark
- Bleeding the brake lines to remove any trapped air
- Replacing worn brake pads with OEM parts

Once these steps are completed, the pedal should feel firm and responsive.

Unusual Noise from the Front Forks

Noise can stem from worn fork seals or inadequate lubrication. Follow these steps:

1. Inspect the fork seals for wear or damage
2. Remove the forks and clean the internals
3. Reapply high quality fork oil as specified in the manual
4. Reinstall and test the suspension for smooth operation

Proper lubrication reduces noise and improves ride quality.

Battery Drain After Long Storage

If your bike has been stored for an extended period, the battery may lose charge. The manual advises:

- Removing the battery and charging it with a smart charger
- Checking for corrosion on battery terminals and cleaning them
- Installing a battery maintainer to keep the battery topped off during storage

These steps help preserve battery life and ensure reliable starts.
