Strategies for Solving the Puzzle

Read the Clues Carefully

Unlike simple fill in the blank exercises, crossword clues often contain subtle hints. A clue such as “Antihistamine that treats allergic rhinitis” may be answered by *loratadine*. Pay attention to synonyms, abbreviations, and context. If you’re unsure, write down the possible answer lengths and see which words fit.

Use a Dictionary and Medical Resources

Keep a reliable dictionary—such as Merriam-Webster—by your side. For drug-specific terms, reference resources like *Stedman’s Pharmacological Dictionary* or *UpToDate*. Many of these sources provide concise definitions that can help you decode tricky clues.

Cross Referencing Answers

Once you fill in a few letters, cross referencing becomes your best ally. The intersection of across and down answers often reveals the correct word. For example, if the down answer for a particular cell is *aspirin*, the across answer must incorporate the letters “A,” “S,” “P,” “I,” “R,” “I,” and “N” at the appropriate positions.

Common Drug Terms to Expect

- Beta blocker: e.g., metoprolol
- Antibiotic: e.g., ceftriaxone
- Analgesic: e.g., acetaminophen
- Antidepressant: e.g., fluoxetine
- Antidiabetic: e.g., metformin

Having a mental list of these common categories can help you make educated guesses when you’re stuck.
