how to refinish hardwood floors

Published: September 3, 2026 | Index ID: #-

Introduction

Hardwood floors are the cornerstone of many homes, offering timeless beauty, durability, and a warm, natural feel that no other flooring can match. Over time, however, they can develop scratches, dents, faded spots, or simply lose their luster from daily wear and tear. Rather than replacing an entire floor—a costly and time consuming endeavor—most homeowners choose to **refinish hardwood floors**. Refinishing restores the original charm, extends the life of the floor, and can even increase a property's resale value.

This guide walks you through the entire process—from assessing your floor's condition to the final protective coat—so you can confidently tackle a DIY refinishing project or know exactly what to expect when hiring a professional. Whether you're a seasoned DIYer or a first time homeowner, the steps below will help you achieve a showroom quality finish while keeping safety, quality, and cost in mind.

Understanding Hardwood Floor Refinishing

What Is Refinishing?

Refinishing is the process of removing the top layer of a hardwood floor—usually the old finish—and applying a new finish to bring out the wood's natural grain and color. It involves sanding the floor to smooth out imperfections, repairing any damage, optionally staining the wood, and finally sealing it with a protective finish.

Why Refinish?

- Restores Original Beauty: Old finishes can yellow, become cloudy, or develop a dull sheen.
- Increases Durability: A fresh seal protects against moisture, stains, and everyday wear.
- Cost Effective: Refinishing a floor can cost as little as 25–30% of a new installation.
- Eco Friendly: Reusing existing flooring reduces waste and environmental impact.
- Improves Resale Value: A freshly finished floor is a strong selling point for potential buyers.

Planning Your Project

Assessing the Condition

Before you buy tools or start sanding, walk around the room and take notes. Look for:

- Scratches, dents, or gouges.
- Uneven spots or low lying areas.
- Water stains or warping.
- Old finish that is peeling or flaking.

Take high resolution photos for reference. This will help you gauge how much sanding and repair work is needed.

Choosing the Right Finish

After sanding, you'll need to apply a new finish. Options include:

1. Oil Based Polyurethane: Durable, gives a warm amber tone, and is great for high traffic areas.
2. Water Based Polyurethane: Dries faster, has lower odor, and preserves the natural color of the wood.

3. Wax or Danish Oil: Offers a low gloss, natural look but requires more frequent maintenance.
4. Shellac: Provides a smooth, satin finish, but is less durable than polyurethane.

Consider your lifestyle, desired sheen, and the wood species before choosing.

Gathering Tools and Materials

Below is a checklist of essential items:

- Drum sander (or belt sander) and sanding belts (80, 120, 150, 180 grit).
- Orbital or hand sander for edges.
- Vacuum with a HEPA filter.
- Shop vac or wet dry vac for dust.
- Safety gear: respirator, goggles, ear protection, gloves.
- Wood filler or epoxy for deep gouges.
- Stain (if desired) and applicators.
- Finish (polyurethane, oil, wax, etc.) and applicator brushes or rollers.
- Cleaning supplies: tack cloth, microfiber mop, mild detergent.
- Drop cloths and masking tape.

Having everything ready before you start will keep the project efficient and reduce downtime.

Preparing the Space

Safety First

Dust from sanding is hazardous. Use a high efficiency respirator and ensure adequate ventilation. Protect your ears with hearing protection, and wear goggles to shield your eyes from dust particles.

Removing Furniture and Fixtures

Clear the entire room of furniture, rugs, and any objects that might obstruct the floor. If you have baseboards, consider removing them to avoid damage during sanding. Keep them in a safe place so you can reinstall them later.

Cleaning the Floor

Before sanding, remove all dust, dirt, and debris. Vacuum thoroughly, then wipe the floor with a damp microfiber mop. Let the floor dry completely before moving on.

Sand the Floor

Choosing the Right Grit

Start with a coarse grit (80–90) to remove the old finish and any high spots. Then progress to finer grits (120, 150, 180) to smooth the surface. The final grit should be fine enough to leave a smooth finish but not so fine that it removes too much wood.

Sandpaper vs. Drum Sander

Drum sanders are ideal for large, flat surfaces and provide an even sanding action. For corners, edges, and tight spaces, use a handheld orbital sander or a sanding block with the appropriate grit.

Sand in the Correct Direction

Always sand in the direction of the wood grain to avoid scratches that run perpendicular to the grain. For multi layered floors, follow the grain pattern of the top layer. This ensures a consistent finish and reduces the need for additional sanding passes.

Repairing Damage

Filling Cracks and Gouges

Use a wood filler or epoxy designed for hardwood floors to fill deep scratches and gouges. Apply the filler with a putty knife, press firmly, and let it cure according to the manufacturer's instructions. Once dry, sand the area lightly to blend it with the surrounding floor.

Leveling the Surface

If your floor is uneven, use a self leveling compound or a floor patching kit. Apply it over low spots, smooth it out, and let it cure. After curing, sand the patched areas to match the surrounding floor level.

Staining (Optional)

Selecting a Stain Color

Staining is optional but can dramatically change the look of your floor. Choose a stain that complements your décor. Light stains can brighten a space, while dark stains add richness and depth.

Applying the Stain

1. Test the stain on a hidden corner to see how it looks on your wood species.
2. Apply the stain with a high quality brush or a foam applicator, following the grain.
3. Wipe off excess stain with a clean rag after the recommended dwell time.
4. Allow the stain to dry fully before moving to the next step.

Remember that each wood species reacts differently, so patience is key.

Sealing and Finishing

Choosing a Finish (Oil, Polyurethane, Wax)

Each finish offers different benefits:

- Oil Based Polyurethane: Durable, warm tone, but higher VOCs and longer drying time.
- Water Based Polyurethane: Low odor, fast drying, preserves natural color.
- Wax or Danish Oil: Low gloss, natural feel, requires regular re application.
- Shellac: Smooth satin finish, but less resistant to moisture.

Application Techniques

1. Shake the finish container well before use.
2. Apply the finish in long, even strokes that follow the grain. Avoid circular motions that create swirl patterns.
3. Use a high quality brush or a foam roller for a smooth application.
4. Let the first coat dry as per the product's instructions (usually 4–6 hours for water based finishes).
5. Gently sand the surface with 220 grit sandpaper or a fine sanding pad to remove any bubbles or imperfections.
6. Wipe away dust with a tack cloth before applying the second coat.
7. Repeat the process for a third coat if needed for extra durability.

After the final coat, allow the floor to cure for at least 24 hours before walking on it, and 48–72 hours before moving furniture back.

Post Refinishing Care

Cleaning Tips

Use a soft, dry microfiber mop or a vacuum with a hardwood floor attachment to keep dust at bay. Avoid using harsh chemicals or abrasive cleaners that can strip the finish. A mild soap solution or a hardwood floor cleaner is sufficient for routine cleaning.

Maintenance Routine

- Place area rugs or mats in high traffic zones to reduce wear.
- Use furniture pads to prevent scratches.
- Replace floor mats and rugs regularly to avoid trapped grit.
- Inspect for damage annually and address issues promptly.

When to Call a Professional

Complex Repairs

If your floor has extensive damage—deep gouges, extensive warping, or structural issues—professional help may be required to ensure a safe and lasting finish.

Time Constraints

Refinishing can take several days, especially if you're sanding large rooms. If you
