somatic therapy exercises for trauma

Published: September 3, 2026 | Index ID: #-

Introduction

Trauma can leave deep imprints on both mind and body, often manifesting as chronic tension, panic attacks, or a feeling of being perpetually on edge. Traditional talk therapies are powerful, yet many people find relief when they also engage the body in the healing process. Somatic therapy, a body centered approach, offers a suite of exercises that help release stored trauma, restore equilibrium, and cultivate resilience. In this guide, we'll explore practical somatic exercises you can try at home, explain how they work, and show you how to weave them into a daily routine that supports lasting recovery.

What Is Somatic Therapy?

Somatic therapy is a therapeutic framework that recognizes the mind and body as an integrated system. Derived from the Greek word *soma* (meaning "body"), the practice focuses on bodily sensations, movement, and breath as pathways to emotional regulation and healing. Rather than merely talking through experiences, somatic practitioners help clients notice subtle physical cues—tightness, tingling, or warmth—and use these signals to process trauma safely. By engaging the nervous system directly, somatic therapy can reset hyper arousal, dissolve avoidance, and foster a sense of safety and presence.

Why Somatic Therapy Works for Trauma

Trauma often hijacks the autonomic nervous system, leading to a persistent fight flight freeze response. The body stores this heightened arousal in muscles, joints, and connective tissue, creating a physical memory of the event. Somatic techniques tap into this memory, allowing the nervous system to release stored tension and re establish a calm baseline. Research shows that body based interventions can reduce symptoms of PTSD, anxiety, and depression, and improve emotional regulation. Moreover, because somatic exercises are typically short and self directed, they empower individuals to take an active role in their healing journey.

Core Principles of Somatic Therapy

- Body Awareness – Developing a non judgmental, present moment focus on physical sensations.
- Safety and Boundaries – Ensuring the client feels secure before delving into deeper memories.
- Resourcing – Identifying internal or external anchors that evoke calm.
- Gradual Exposure – Slowly approaching traumatic material to avoid overwhelm.
- Integration – Linking bodily experiences with emotional and cognitive insights.

Key Somatic Therapy Exercises for Trauma

1. Grounding and Body Scan

The grounding body scan is a foundational exercise that brings attention to the feet, legs, and pelvis. Begin by standing or sitting comfortably, feet planted firmly on the floor. Slowly move your awareness from your toes up through each body segment, noting any sensations—tightness, warmth, or tingling—without judgment. As you scan, imagine roots growing from your feet into the earth, anchoring you. This simple practice calms the nervous

system, helps you stay present, and creates a safe base for exploring deeper emotions.

2. Breath Awareness and Diaphragmatic Breathing

Breath is a powerful regulator of the autonomic nervous system. Diaphragmatic breathing engages the lower belly and encourages the parasympathetic response. Inhale slowly through the nose, allowing the belly to expand; exhale gently through the mouth, letting the belly contract. Aim for a 4 5 6 4 rhythm: inhale for four counts, hold for five, exhale for six, and pause for four. Pair this breath with a gentle body scan, noticing how each inhale releases tension and each exhale invites calm.

3. Gentle Movement and Stretching

Movement is a natural way to release stored trauma. Start with light stretches that focus on the neck, shoulders, and hips—areas that often hold emotional tension. Try the “cat cow” pose: on hands and knees, arch the spine upward (cat) and then dip it downward (cow), synchronizing breath with each motion. Incorporate slow, deliberate shoulder rolls, wrist circles, and ankle flexes. Even a few minutes of mindful movement can reset the nervous system and open pathways for emotional processing.

4. Tapping (EFT) and Body Touch

Emotional Freedom Techniques (EFT) combine tapping on meridian points with focused attention on a specific memory or emotion. Place the fingertips of the dominant hand on the side of the hand (the “karate chop” point) and tap gently while repeating a self affirmation such as, “I am safe.” Move through points on the face, head, and chest. The rhythmic tapping stimulates the nervous system, reducing arousal and allowing the body to release stored tension. Body touch, such as placing a hand on the chest or belly, can also provide a comforting anchor.

5. Anchor Points and Safe Space Visualization

Anchor points are physical locations that evoke feelings of safety and calm. Identify a spot in your body—perhaps the inside of the wrist, the top of the head, or the center of the chest—that feels grounding. Whenever you notice distress, press lightly to the anchor and breathe deeply. Pair this with a safe space visualization: picture a place where you feel protected—an old tree, a cozy cabin, or a quiet beach. Engage all senses in the image, noticing the textures, sounds, and scents. This dual focus of touch and visualization can quickly shift your nervous system from hyper arousal to calm.

6. Progressive Muscle Relaxation

Progressive Muscle Relaxation (PMR) involves systematically tensing and relaxing muscle groups. Start at the feet, tighten the calf muscles for 5–10 seconds, then release. Move upward through the legs, abdomen, arms, and face. Notice the contrast between tension and release. PMR trains the body to recognize tension patterns, enabling you to spot early signs of stress and intervene with relaxation techniques before they spiral into full-blown anxiety.

7. Somatic Experiencing Techniques

Somatic Experiencing (SE) focuses on the body’s natural ability to discharge stored trauma energy. A common SE exercise is “titration”: gently bring a traumatic memory to mind, but only just enough to notice the physical response—perhaps a tightening in the chest. Then pause, breathe, and let the sensation dissipate. Repeating this process helps the nervous system complete unfinished physiological responses, reducing the urge to freeze or flee.

8. Journaling with Body Sensations

Combining body awareness with reflective writing creates a powerful feedback loop. Before journaling, spend a few minutes in a body scan, noting any sensations. Then write about the experience: what feelings arose, how the body responded, and any insights. This practice encourages integration of bodily and cognitive information, deepening

self understanding and reinforcing the therapeutic gains made in the body.

9. Guided Imagery with Physical Anchors

Guided imagery pairs mental visualization with physical movement or touch. For example, imagine walking through a forest while gently tapping your knees. The imagery evokes calm, while the tapping provides a tangible anchor to stay present. This dual engagement can be especially useful during moments of panic, helping to redirect attention away from distressing thoughts.

10. Movement Therapy (Dance, Yoga, etc.)

Dance, yoga, and other expressive movement therapies are effective somatic tools for trauma survivors. A gentle yoga flow that emphasizes breath and slow transitions can release tension and cultivate body awareness. Dance, even improvised, allows the body to express emotions that may be difficult to verbalize. The key is to move mindfully, listening to the body's signals, and to honor any limits or discomforts that arise.

How to Integrate These Exercises Into Your Routine

1. Start Small – Choose one exercise (e.g., grounding scan) and practice it for 5 minutes each day.
2. Set a Consistent Time – Morning or evening, find a quiet slot that fits your schedule.
3. Use Reminders – Place sticky notes or set phone alerts to prompt practice.
4. Track Progress – Keep a simple log noting the exercise, duration, and any sensations or emotions.
5. Gradually Expand – As comfort grows, add another exercise or increase duration by 2 3 minutes weekly.
6. Pair with Support – Share your practice with a therapist or trusted friend for accountability.
7. Review and Adjust – Reflect monthly: what's working, what feels uncomfortable, and tweak accordingly.

Safety Tips and When to Seek Professional Help

- Always honor your limits—if an exercise triggers intense distress, pause and breathe.
- Avoid pushing through pain; gentle, slow movements are key.
- Practice in a safe environment—quiet, familiar, and free from distractions.
- Use a supportive partner or therapist if you feel overwhelmed.
- Seek professional help if symptoms of trauma worsen, or if you experience dissociation, panic attacks, or intrusive memories that interfere with daily life.

Frequently Asked Questions

What if I don't feel any physical sensations during the exercises?

It's common for new practitioners to notice subtle or no sensations at first. Try slowing down, focusing on breath, and gently reminding yourself to notice small shifts—tightness, warmth, or tingling. Over time, as body awareness deepens, sensations often become more pronounced.

Can somatic exercises replace therapy?

Somatic exercises are complementary, not a substitute for professional therapy. They can enhance therapeutic outcomes, but for complex trauma, guided work with a trained therapist remains essential.

How long should I practice each exercise?

Start with 5–10 minutes and adjust based on your comfort and schedule. Consistency matters more than duration—daily practice yields cumulative benefits.

Is it okay to practice these exercises after a panic attack?

Yes. Grounding and breathing techniques are especially useful post attack to re establish calm. Avoid intense movement immediately after a panic; instead, focus on slow breath and gentle grounding.

Conclusion

Somatic therapy exercises for trauma offer a tangible, body centered path to healing. By cultivating awareness of breath, movement, and subtle sensations,
